Technology Stacks

- Back-end : Python Flask
- Database : postgres

Case scenario

- Create a user
- login user using jwt token and refresh token (Expired in 60 min)
- Create a user table (Table attributes: Username, Email, password).

Note: Development should be

- Clean code with Comments.
- Project Structure.
- Error Handling.
- Input Validation.
- Brief documentation about development.
  (Create a Github repository for the development and documentation.)
